Write a C program accept three digit number find out reverse number.

Example: 123=321

```
void main()
{
    int n,m,rev=0;
    clrscr();
    printf("\n Enter any three digit number ");           Debug
    scanf("%d",&n);                                       123

    m=n%10;                                               3
    n=n/10;                                               12
    rev=rev*10+m;                                         0+3  3

    m=n%10;                                               2
    n=n/10;                                               1
    rev=rev*10+m;                                         30+2  32

    m=n%10;                                               1
    rev=rev*10+m;                                         320+1  321

    printf("\n Reverse number. %d",digit);               321
    getch();
}
```
